

Description of running of the program

Expected Output

Our goal was to translate images from domain X to domain Y. After enough training given, you should start getting some realistic images that does not look fake anymore.

Testing

Once training is finished, we can visually verify the outcome of training. Simultaneously, you can observe loss plots to see if it converged or not. Similar plots are also added in report.

Screenshots

Here, we have stopped training after just 1 epoch. That is why output images looks fake. Given good amount of time it will produce relatively good results.
